

Buddies Day Out With Dolphins

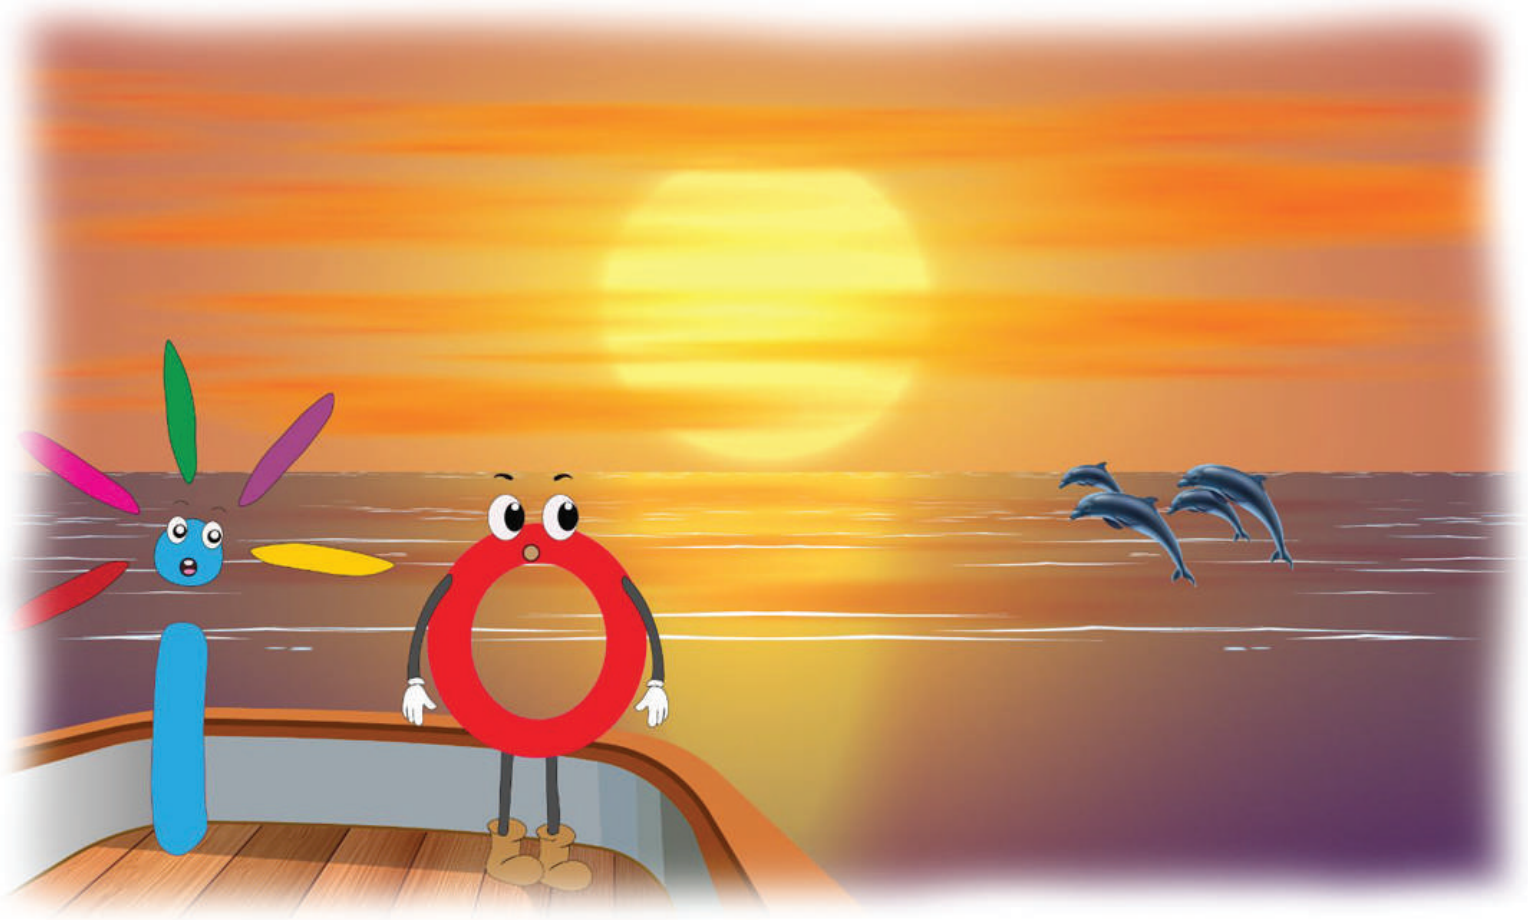

An {iPi}CreativeLab Production

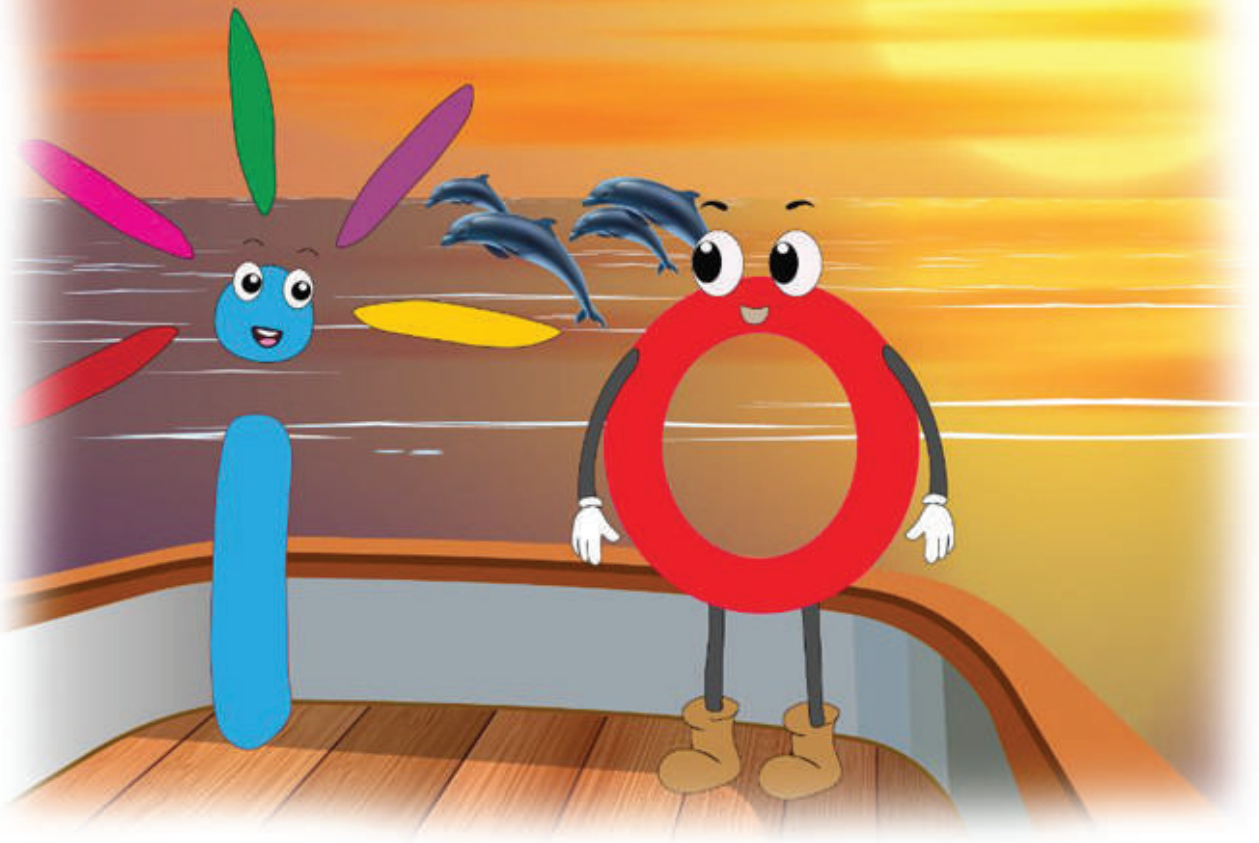

One fine evening in June, O Buddy and I Buddy decided to go and watch the scenic view in the Pacific ocean near Virginia. While sailing they were talking about the clean and fresh air around the ocean and scenic views.

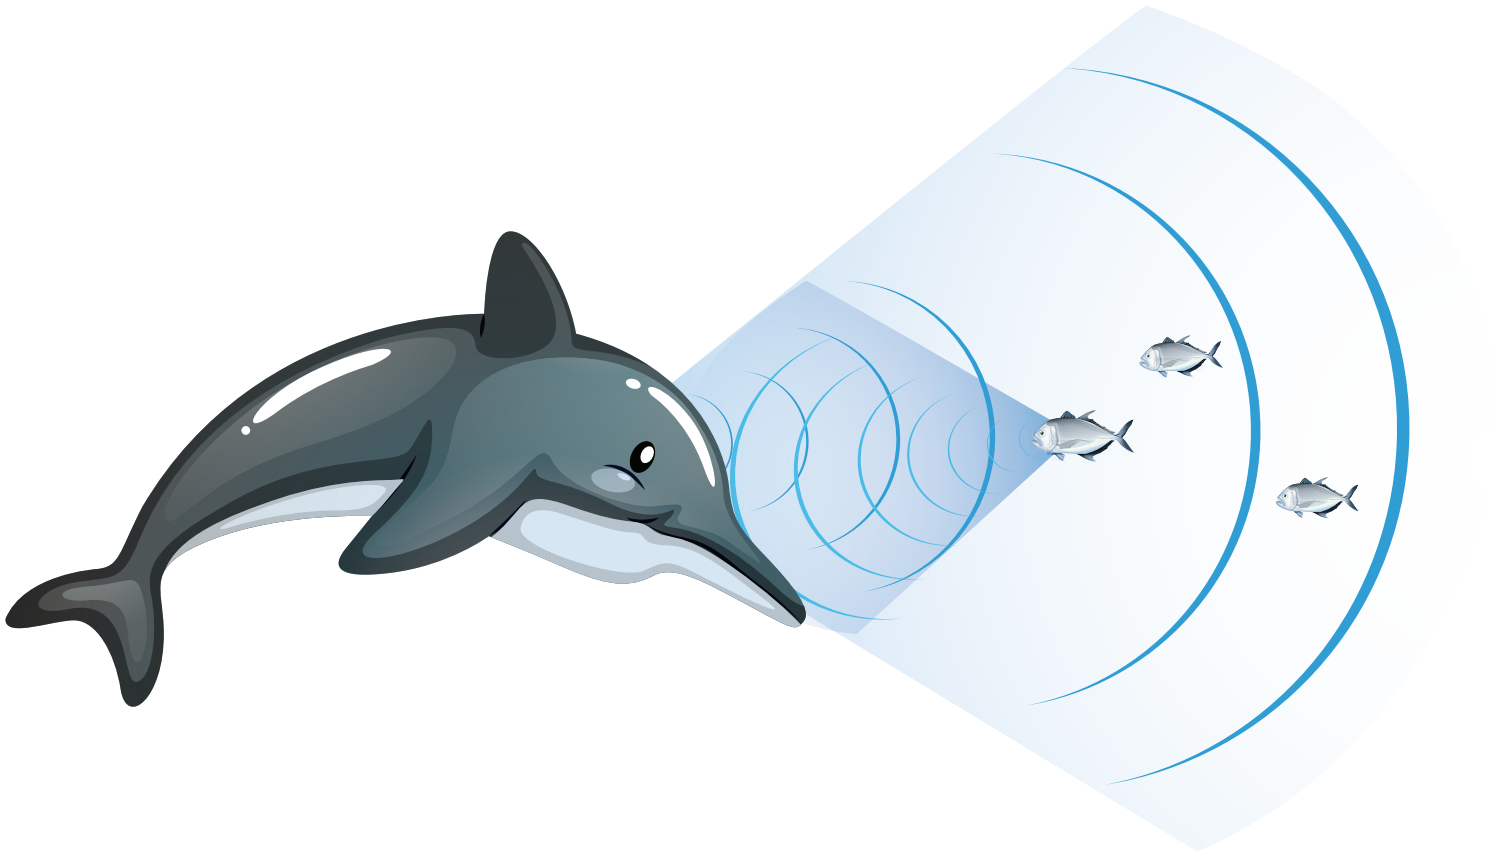

After a while, O buddy starts explaining about the generation of oxygen in the ocean, he says “You know i buddy, scientists say 50-60% of oxygen comes directly from the ocean. Plants and animals also consume the oxygen to survive. Oxygen is also consumed when dead plants and animals decay in the ocean.”

Then suddenly i buddy noticed a few flying fishes in the ocean, they were far away from them and i buddy was unable to judge the name of the fish but quickly he realized that they are dolphins. Then both the buddies sailed faster to have a close and eye-pleasing look of the Dolphins.

While watching, they talked about the dolphins. i buddy asked O buddy, “I don't know how dolphins communicate and travel.” So, O buddy explains “Dolphins use echolocation, after emitting a series of high-pitched clicks, they listen for the echoes to bounce off from their surroundings.”

O buddy continues, “Based on these echoes, dolphins can judge where they are in space and determine the size and shape of nearby objects.” i buddy looks like he wants to know more about dolphins.

O buddy continues “Also dolphins are warm-blooded mammals and so it is easier for them to regulate their body temperature in any environment.”

i buddy seems a little confused with a fact and asked
O buddy, “When dolphins travel so much, what do
they eat and how they keep that food with them, I
mean I don't see bags hanging around them.” (both
laughed together).

O buddy replies” Dolphins eat a variety of fish, squid, shrimps, jellyfish and octopuses from the ocean. Dolphins also have 2 stomachs: One is used for storage of food and the other one is used for digestion. And the fun fact is that they never chew their food, they swallow it as a whole.” “So, why do they have teeth?” asked i Buddy. “Their teeth are used only to catch their prey.”, said O Buddy.

Then, excited i buddy also shared what he has heard till date about dolphins. “They are known to be great divers, being creatures of the sea, they can dive up to 1,000 feet underwater also they are very interactive and friendly to animals and human around “.

O Buddy says “It has been proved by scientists that dolphins give themselves names. They develop their own individual whistles and they recognize theirs and other dolphin’s names.” “OMG!! They talk to each other and the fellow Dolphins.”, said i buddy.

i buddy starts imagining becoming friends with dolphins, talking to them and riding them!
